Abstract

In this paper we generalize to *unbounded* convex subsets C of *hyperbolic* spaces results obtained by W.A. Kirk and R. Espínola on approximate fixed points of nonexpansive mappings in product spaces $(C \times M)_\infty$, where M is a metric space and C is a nonempty, convex, closed and bounded subset of a normed or a CAT(0)-space. We extend the results further, to families $(C_u)_{u \in M}$ of unbounded convex subsets of a hyperbolic space. The key ingredient in obtaining these generalizations is a uniform quantitative version of a theorem due to Borwein, Reich and Shafrir, obtained by the authors in a previous paper using techniques from mathematical logic. Inspired by that, we introduce in the last section the notion of *uniform approximate fixed point property* for sets C and classes of self-mappings of C . The paper ends with an open problem.

Keywords: Proof mining, metric fixed point theory, nonexpansive functions, approximate fixed points, product spaces

MSC: 47H10, 47H09, 03F10

1 Introduction

This paper presents applications of a case study in the project of *proof mining*, by which we mean the logical analysis of mathematical proofs with the aim of extracting new numerically relevant information hidden in the proofs.

More specifically, we are concerned with the approximate fixed points for nonexpansive mappings in product spaces.

The main tool used in this paper is a quantitative version (Theorem 1.3) of a theorem due to [1] (see Theorem 1.2) which was obtained in [10] by logical analysis of the original proof of Theorem 1.2.

Let (X, ρ) be a metric space, and $C \subseteq X$ a nonempty subset. A mapping $T : C \rightarrow C$ is called *nonexpansive* if for all $x, y \in C$,

$$\rho(T(x), T(y)) \leq \rho(x, y).$$

The metric space (X, ρ) is said to have the *approximate fixed point property* (AFPP) for nonexpansive mappings if each nonexpansive mapping $T : X \rightarrow X$ has an approximate fixed point sequence; that is, a sequence $(u_n)_{n \in \mathbb{N}}$ in X for which $\lim_{n \rightarrow \infty} \rho(u_n, T(u_n)) = 0$. It is easy to see that this is equivalent with

$$r_X(T) := \inf\{\rho(x, T(x)) \mid x \in X\} = 0.$$

If (X, ρ) and (Y, d) are metric spaces, then the metric d_∞ on $X \times Y$ is defined in the usual way:

$$d_\infty((x, u), (y, v)) = \max\{\rho(x, y), d(u, v)\}$$

for $(x, u), (y, v) \in X \times Y$. We denote by $(X \times Y)_\infty$ the metric space thus obtained.

The following theorem was proved first by Espínola and Kirk [2] for normed spaces and then proved by Kirk [8, Theorem 25, Remark 26] for all CAT(0)-spaces.

Theorem 1.1. *Assume that X is a normed space or a CAT(0)-space, $C \subseteq X$ is a nonempty, convex, closed and bounded subset of X . If (M, d) is a metric space with the AFPP for nonexpansive mappings, then*

$$H := (C \times M)_\infty$$

has the AFPP for nonexpansive mappings.

Kirk's proof in [8] actually also holds for the class of *hyperbolic spaces* as introduced by the first author in [9]:

A *hyperbolic space*¹ is a triple (X, ρ, W) where (X, ρ) is a metric space and $W : X \times X \times [0, 1] \rightarrow X$ is such that

$$\begin{aligned} (W1) \quad & \rho(z, W(x, y, \lambda)) \leq (1 - \lambda)\rho(z, x) + \lambda\rho(z, y), \\ (W2) \quad & \rho(W(x, y, \lambda), W(x, y, \tilde{\lambda})) = |\lambda - \tilde{\lambda}| \cdot \rho(x, y), \\ (W3) \quad & W(x, y, \lambda) = W(y, x, 1 - \lambda), \\ (W4) \quad & \rho(W(x, z, \lambda), W(y, w, \lambda)) \leq (1 - \lambda)\rho(x, y) + \lambda\rho(z, w). \end{aligned}$$

If only axiom (W1) is assumed this structure is a convex metric space in the sense of Takahashi [13]. If (W1)-(W3) are assumed, the notion is equivalent to Kirk's spaces of hyperbolic type [4]. Axiom (W4) is used e.g. in [6, 11]. However, the concept of hyperbolic space as defined in [11] is somewhat more restrictive than ours, as it is assumed that the space contains metric lines. This

¹See [9] for discussion of this and related notions.

has the consequence that only CAT(0)-spaces which have the unique geodesic line extension property are included whereas in our definition all CAT(0)-spaces are covered. The notion of space of hyperbolic type would be too general though for our purposes as the proof of Theorem 1.2 uses (W4) in an essential way.

The class of hyperbolic spaces contains all normed linear spaces and convex subsets thereof, but also the open unit ball in complex Hilbert spaces with the hyperbolic metric as well as Hadamard manifolds and CAT(0)-spaces in the sense of Gromov.

Remark: Kirk actually claims that his proof would go through for the still larger class of spaces of hyperbolic type as defined in [4]. However, the proof of Theorem 25 in [8] uses axiom (W4) for the proof of Lemma 3 (used for $\lambda = \frac{1}{2}$) which does not seem to hold in this setting in general. The proof does work, though, for the more restricted notion defined in [6] (and called there space of hyperbolic type as well) which is the same notion as the one used in [11]. But this includes only CAT(0)-spaces with the geodesic line extension property. Our more liberal notion avoids this and Kirk's proof, nevertheless, goes through.

If $x, y \in X$, and $\lambda \in [0, 1]$ then we use the notation $(1 - \lambda)x \oplus \lambda y$ for $W(x, y, \lambda)$.

If $C \subseteq X$ is a nonempty convex subset of a hyperbolic space (X, ρ, W) , and $T : C \rightarrow C$ is nonexpansive, then for each sequence $(\lambda_n)_{n \in \mathbb{N}}$ in $[0, 1]$, we can define the *Krasnoselski-Mann iteration* starting from $x \in C$ by

$$x_0 := x, \quad x_{n+1} := (1 - \lambda_n)x_n \oplus \lambda_n T(x_n). \quad (1)$$

An important result in the fixed point theory for nonexpansive mappings is the following theorem, due to Borwein, Reich, and Shafrir² (generalizing earlier results of Ishikawa [5], Goebel and Kirk [4]).

Theorem 1.2. *[1] If $(\lambda_n)_{n \in \mathbb{N}}$ is a sequence in $[0, 1]$ which is divergent in sum and bounded away from 1 then for all $x \in C$,*

$$\lim_{n \rightarrow \infty} \rho(x_n, T(x_n)) = r_C(T).$$

In [10], we obtained (even for the more general class of directionally nonexpansive functions as introduced in [7]) the following quantitative version of Theorem 1.2 (which subsequently turned out to be an instance of a general logical metatheorem, see [3]):

Theorem 1.3. *Let (X, ρ, W) be a hyperbolic space, $C \subseteq X$ a nonempty convex subset and $T : C \rightarrow C$ a nonexpansive mapping. Let $(\lambda_n)_{n \in \mathbb{N}}$ be a sequence in $[0, 1)$, and $K \in \mathbb{N}, \alpha : \mathbb{N} \rightarrow \mathbb{N}$ be such that for all $n \in \mathbb{N}$,*

$$\lambda_n \leq 1 - \frac{1}{K}, \quad \text{and } n \leq \sum_{i=0}^{\alpha(n)} \lambda_i. \quad (2)$$

²In [1], Borwein, Reich and Shafrir actually only state the result for their more restricted notion of hyperbolic space as defined in [6]. However, from [10] it follows that the result holds for our concept of hyperbolic space as well.

Let $x, x^* \in C$ and $b > 0$ be such that

$$\rho(x, T(x)) \leq b \wedge \rho(x, x^*) \leq b.$$

Then the following holds

$$\forall \varepsilon > 0 \forall n \geq h(\varepsilon, b, K, \alpha) (\rho(x_n, T(x_n)) \leq \rho(x^*, T(x^*)) + \varepsilon),$$

where³

$$\begin{aligned} h(\varepsilon, b, K, \alpha) &= \hat{\alpha}(\lceil 2b \cdot \exp(K(M+1)) \rceil + 1, M), \text{ with} \\ M \in \mathbb{N} \text{ is such that } M &\geq \frac{1+2b}{\varepsilon}, \\ \hat{\alpha}(0, n) &:= \tilde{\alpha}(0, n), \quad \hat{\alpha}(i+1, n) := \tilde{\alpha}(\hat{\alpha}(i, n), n), \\ \tilde{\alpha}(i, n) &:= i + \alpha^+(i, n), \quad \alpha^+(i, n) := \max\{\alpha'(j, n) : j \leq i\}, \\ \alpha'(i, n) &:= \alpha(n+i) - i + 1, \quad (i, n \in \mathbb{N}). \end{aligned}$$

Using Theorem 1.3, the following quantitative version of a theorem due to Ishikawa [5] (for normed spaces) and Goebel and Kirk [4] (for spaces of hyperbolic type) was obtained in [10] (again the general form of this quantitative version is guaranteed by a logical metatheorem, see [3]):

Theorem 1.4. [10] Let $(X, \rho, W), C, (\lambda_n), K, \alpha$ be as in the previous theorem. Let $b > 0, x, x^* \in C$ be such that

$$\rho(x, x^*) \leq b \wedge \forall m, n \in \mathbb{N} (\rho(x_n^*, x_m^*) \leq b). \quad (3)$$

Then the following holds

$$\forall \varepsilon > 0 \forall n \geq \tilde{h}(\varepsilon, b, K, \alpha) (\rho(x_n, T(x_n)) \leq \varepsilon),$$

where

$$\begin{aligned} \tilde{h}(\varepsilon, b, K, \alpha) &= \hat{\alpha}(\lceil 12b \cdot \exp(K(M+1)) \rceil + 1, M), \text{ with} \\ M \in \mathbb{N} \text{ is such that } M &\geq \frac{1+6b}{\varepsilon}, \\ \text{and } \hat{\alpha} &\text{ as before.} \end{aligned}$$

The main significance of the bounds in the previous theorems is that they depend on x, x^*, T, C, X only via b (and on (λ_n) only via K, α). In particular, if in Theorem 1.4, C is assumed to have a bounded diameter, then the convergence $\rho(x_n, T(x_n)) \rightarrow 0$ is uniform in x and T . This result was first obtained (ineffectively) in [4] and used in [8] to prove Theorem 1.1 discussed above.

In this paper, we shall use our strong uniformity results to approach (in the more general case of hyperbolic spaces) the following problem : what results can we obtain if we drop the hypothesis of C being bounded from Theorem 1.1?

2 Main results

In the following, (X, ρ, W) always is a hyperbolic space.

³ $n \dot{-} 1 = \max\{0, n - 1\}$.

2.1 The case of one convex subset C

Let $C \subseteq X$ be a nonempty convex subset. We assume that (M, d) is a metric space which has the AFPP for nonexpansive mappings. Let $H := (C \times M)_\infty$ and $P_1 : H \rightarrow C, P_2 : H \rightarrow M$ be the coordinate projections. Finally, let (λ_n) be a sequence in $[0, 1]$.

For each nonexpansive function $T : H \rightarrow H$ and for each $u \in M$, let us define

$$T_u : C \rightarrow C, \quad T_u(x) = (P_1 \circ T)(x, u).$$

It is easy to see that T_u is nonexpansive, so we can associate with T_u the Krasnoselski-Mann iteration (x_n^u) starting with an arbitrary $x \in C$.

In the sequel, $\delta : M \rightarrow C$ is a nonexpansive function, which *selects* for each $u \in M$ an element $\delta(u) \in C$. Trivial examples of such nonexpansive selection functions are the constant ones.

For simplicity, we shall denote the Krasnoselski-Mann iteration starting from $\delta(u)$ and associated with T_u by $(\delta(u))_n$.

For each $n \geq 0$, we define

$$\varphi_n : M \rightarrow M, \quad \varphi_n(u) = (P_2 \circ T)((\delta(u))_n, u).$$

The following lemma collects some properties we will use in our proofs.

Lemma 2.1.

(i) for all $u \in M, x, y \in C$, the sequences $(\rho(x_n^u, T_u(x_n^u)))$ and $(\rho(x_n^u, y_n^u))$ are nonincreasing;

(ii) for all $n \geq 0, u, v \in M$, and $x, y \in C$

$$\rho(x_n^u, y_n^v) \leq \max\{\rho(x, y), d(u, v)\} = d_\infty((x, u), (y, v)); \quad (4)$$

(iii) for all $n \geq 0, \varphi_n$ is nonexpansive;

(iv) there is a sequence (z_n) in M such that for all $n \geq 0$,

$$d(z_n, \varphi_n(z_n)) \leq \frac{1}{n}, \text{ and} \\ d_\infty(((\delta(z_n))_n, z_n), T((\delta(z_n))_n, z_n)) \leq \max\left\{\rho((\delta(z_n))_n, T_{z_n}((\delta(z_n))_n)), \frac{1}{n}\right\}.$$

Proof. (i) Apply, for example, [10, Proposition 3.4, Lemma 3.8], whose proofs immediately generalize to our notion of hyperbolic space.

(ii) The proof is by induction on n . The case $n = 0$ is immediate. Assume

that (4) is true for n . We get

$$\begin{aligned}
\rho(x_{n+1}^u, y_{n+1}^v) &= \rho((1 - \lambda_n)x_n^u \oplus \lambda_n T_u(x_n^u), (1 - \lambda_n)y_n^v \oplus \lambda_n T_v(y_n^v)) \\
&\leq (1 - \lambda_n)\rho(x_n^u, y_n^v) + \lambda_n \rho(T_u(x_n^u), T_v(y_n^v)) \quad \text{by (W4)} \\
&\leq (1 - \lambda_n) \max\{\rho(x, y), d(u, v)\} + \\
&\quad + \lambda_n d_\infty(T(x_n^u, u), T(y_n^v, v)) \\
&\leq (1 - \lambda_n) \max\{\rho(x, y), d(u, v)\} + \\
&\quad + \lambda_n d_\infty((x_n^u, u), (y_n^v, v)) \\
&= (1 - \lambda_n) \max\{\rho(x, y), d(u, v)\} + \\
&\quad + \lambda_n \max\{\rho(x_n^u, y_n^v), d(u, v)\} \\
&\leq (1 - \lambda_n) \max\{\rho(x, y), d(u, v)\} + \\
&\quad + \lambda_n \max\{\rho(x, y), d(u, v)\} \\
&= \max\{\rho(x, y), d(u, v)\}.
\end{aligned}$$

(iii) We get that

$$\begin{aligned}
d(\varphi_n(u), \varphi_n(v)) &\leq d_\infty(T((\delta(u))_n, u), T((\delta(v))_n, v)) \\
&\leq d_\infty(((\delta(u))_n, u), ((\delta(v))_n, v)) \\
&= \max\{\rho((\delta(u))_n, (\delta(v))_n), d(u, v)\} \\
&\leq \max\{\rho(\delta(u), \delta(v)), d(u, v)\}, \quad \text{by (ii)} \\
&= d(u, v), \quad \text{since } \delta \text{ is nonexpansive.}
\end{aligned}$$

(iv) Apply (iii) and the fact that M has the AFPP for nonexpansive mappings to get (z_n) in M such that

$$d(z_n, \varphi_n(z_n)) \leq \frac{1}{n}.$$

The second inequality follows immediately. $\square$

$\square$

Applying Theorem 1.3 to the family $(T_u)_{u \in M}$ of nonexpansive mappings, we can prove the following result.

Lemma 2.2. (Main technical lemma)

Let (λ_n) be a sequence in $[0, 1)$, and $K \in \mathbb{N}, \alpha : \mathbb{N} \rightarrow \mathbb{N}$ satisfying (2). Let $b_1, b_2 > 0$ be such that

$$\forall u \in M \exists x^* \in C (\rho(\delta(u), x^*) \leq b_1 \wedge \rho(x^*, T_u(x^*)) \leq b_2). \quad (5)$$

Then there are sequences (z_n) in M and (x_n^*) in C such that

$$\forall n \in \mathbb{N} (\rho(\delta(z_n), x_n^*) \leq b_1 \wedge \rho(x_n^*, T_{z_n}(x_n^*)) \leq b_2)$$

and for all $\varepsilon > 0$,

$$\forall n \geq g(\varepsilon, b_1, b_2, K, \alpha) (d_\infty(((\delta(z_n))_n, z_n), T((\delta(z_n))_n, z_n)) \leq \rho(x_n^*, T_{z_n}(x_n^*)) + \varepsilon),$$

where

$$g(\varepsilon, b_1, b_2, K, \alpha) = \max \left\{ \left\lceil \frac{1}{\varepsilon} \right\rceil + 1, h(\varepsilon, 2b_1 + b_2, K, \alpha) \right\},$$

and h is as in Theorem 1.3.

Proof. First, let us remark that for all $u \in M$, by (5) and the fact that T_u is nonexpansive, there exists an $x^* \in C$ such that

$$\begin{aligned} \rho(\delta(u), T_u(\delta(u))) &\leq \rho(\delta(u), x^*) + \rho(x^*, T_u(x^*)) + \rho(T_u(x^*), T_u(\delta(u))) \\ &\leq 2b_1 + b_2. \end{aligned} \quad (6)$$

Let (z_n) be as in Lemma 2.1(iv), and (x_n^*) be the sequence in C obtained by applying (5) to $u := z_n$. For every $n \in \mathbb{N}$, $T_{z_n} : C \rightarrow C$ is nonexpansive, and $(\delta(z_n))_m$ is the Krasnoselski-Mann iteration associated with T_{z_n} , starting with $\delta(z_n) \in C$. By the hypothesis and (6), we have that for all $n \geq 0$

$$\rho(\delta(z_n), T_{z_n}(\delta(z_n))) \leq 2b_1 + b_2 \wedge \rho(\delta(z_n), x_n^*) \leq b_1 \leq 2b_1 + b_2. \quad (7)$$

Now let $\varepsilon > 0$ and $n \geq g(\varepsilon, b_1, b_2, K, \alpha)$. Then $n \geq h(\varepsilon, 2b_1 + b_2, K, \alpha)$, and we can apply Theorem 1.3 to get that

$$\rho((\delta(z_n))_n, T_{z_n}((\delta(z_n))_n)) \leq \rho(x_n^*, T_{z_n}(x_n^*)) + \varepsilon.$$

Hence, by Lemma 2.1(iv)

$$\begin{aligned} d_\infty(((\delta(z_n))_n, z_n), T((\delta(z_n))_n, z_n)) &\leq \max \left\{ \rho(x_n^*, T_{z_n}(x_n^*)) + \varepsilon, \frac{1}{n} \right\} \\ &= \rho(x_n^*, T_{z_n}(x_n^*)) + \varepsilon, \end{aligned}$$

since $n \geq g(\varepsilon, b_1, b_2, K, \alpha) \geq \left\lceil \frac{1}{\varepsilon} \right\rceil + 1$, so $\frac{1}{n} < \varepsilon$. □ □

We are now in position to prove the main theorems of this section.

Theorem 2.3. *Assume that*

$$\sup_{u \in M} r_C(T_u) < \infty,$$

and $\varphi : \mathbb{R}_+^* \rightarrow \mathbb{R}_+^*$ is such that for each $\varepsilon > 0$ and $v \in M$ there exists $x^* \in C$ satisfying

$$\rho(\delta(v), x^*) \leq \varphi(\varepsilon) \wedge \rho(x^*, T_v(x^*)) \leq \sup_{u \in M} r_C(T_u) + \varepsilon. \quad (8)$$

Then

$$r_H(T) \leq \sup_{u \in M} r_C(T_u). \quad (9)$$

Proof. Let $\varepsilon > 0$. Define $b_1 := \varphi(\varepsilon)$ and $b_2 := \sup_{u \in M} r_C(T_u) + \varepsilon$. Then, by (8), we get that

$$\forall v \in M \exists x^* \in C(\rho(\delta(v), x^*) \leq b_1 \wedge \rho(x^*, T_v(x^*)) \leq b_2),$$

so (5) is satisfied. Let $(\lambda_n), K, \alpha$ be as in the hypothesis of Lemma 2.2. Then we can apply that lemma to get sequences (z_n) in M and (x_n^*) in C such that

$$\forall n \in \mathbb{N}(\rho(x_n^*, T_{z_n}(x_n^*)) \leq b_2),$$

and for all $n \geq g(\varepsilon, b_1, b_2, K, \alpha)$,

$$d_\infty(((\delta(z_n))_n, z_n), T((\delta(z_n))_n, z_n)) \leq \rho(x_n^*, T_{z_n}(x_n^*)) + \varepsilon,$$

where $g(\varepsilon, b_1, b_2, K, \alpha)$ is defined as in Lemma 2.2. It follows that

$$\begin{aligned} r_H(T) &\leq d_\infty(((\delta(z_n))_n, z_n), T((\delta(z_n))_n, z_n)) \leq \rho(x_n^*, T_{z_n}(x_n^*)) + \varepsilon \\ &\leq b_2 + \varepsilon = \sup_{u \in M} r_C(T_u) + 2\varepsilon. \end{aligned}$$

Since $\varepsilon > 0$ was arbitrary, (9) follows. $\square$ $\square$

The next theorem is obtained by applying Theorem 1.4 to the family $(T_u)_{u \in M}$.

Theorem 2.4. *Let $(\lambda_n), K, \alpha$ be as in the hypothesis of Theorem 1.3. Assume that there is $b > 0$ such that*

$$\forall u \in M \exists y \in C(\rho(\delta(u), y) \leq b \wedge \forall m, p \in \mathbb{N}(\rho(y_m^u, y_p^u) \leq b)), \quad (10)$$

where (y_n^u) is the Krasnoselski-Mann iteration from y , associated with T_u .

Then $r_H(T) = 0$.

Proof. Take (z_n) as in Lemma 2.1(iv). By hypothesis, for every $n \in \mathbb{N}$ there exists $y \in C$ such that

$$\rho(\delta(z_n), y) \leq b \wedge \forall m, p \in \mathbb{N}(\rho(y_m^{z_n}, y_p^{z_n}) \leq b),$$

Let now $\varepsilon > 0$ and $n \geq \tilde{g}(\varepsilon, b, K, \alpha)$. We are in position to apply Theorem 1.4 to get that

$$\rho((\delta(z_n))_n, T_{z_n}((\delta(z_n))_n)) \leq \varepsilon.$$

Then, by Lemma 2.1(iv)

$$\begin{aligned} d_\infty(((\delta(z_n))_n, z_n), T((\delta(z_n))_n, z_n)) &\leq \max\left\{\varepsilon, \frac{1}{n}\right\} \\ &= \varepsilon, \end{aligned}$$

since $n \geq \tilde{g}(\varepsilon, b, K, \alpha) \geq \left\lceil \frac{1}{\varepsilon} \right\rceil + 1$, so $\frac{1}{n} < \varepsilon$. In particular, it follows that $r_H(T) = 0$. $\square$ $\square$

The above theorems have some straightforward consequences.

Corollary 2.5. *Assume that $\varphi : \mathbb{R}_+^* \rightarrow \mathbb{R}_+^*$ is such that*

$$\forall \varepsilon > 0 \forall u \in M \exists x^* \in C(\rho(\delta(u), x^*) \leq \varphi(\varepsilon) \wedge \rho(x^*, T_u(x^*)) \leq \varepsilon). \quad (11)$$

Then $r_H(T) = 0$.

Proof. From the hypothesis, it follows immediately that $r_C(T_u) = 0$ for all $u \in M$. Thus, $\sup_{u \in M} r_C(T_u) = 0$. Apply now Theorem 2.3. $\square$ $\square$

Corollary 2.6. *Assume that for all $u \in M$, the Krasnoselski-Mann iteration $(\delta(u))_n$ is bounded. Then $r_H(T) = 0$.*

Proof. Apply Theorem 2.4 with $y := \delta(u)$. $\square$ $\square$

Theorem 1.1 is an immediate consequence of Corollary 2.6, since if C is bounded, then $(\delta(u))_n$ is bounded by the diameter of C for each $u \in M$.

2.2 Families of unbounded convex sets

In this section we indicate that all the above results can be generalized to families $(C_u)_{u \in M}$ of nonempty *unbounded* convex subsets of the hyperbolic space (X, ρ, W) .

Let $(C_u)_{u \in M} \subseteq X$ be a family of convex sets such that there exists a nonexpansive *selection* function $\delta : M \rightarrow \bigcup_{u \in M} C_u$, that is a nonexpansive function with the property

$$\forall u \in M (\delta(u) \in C_u). \quad (12)$$

We consider the following subspace of $(X \times M)_\infty$:

$$H := \{(x, u) : u \in M, x \in C_u\}.$$

Let $P_1 : H \rightarrow \bigcup_{u \in M} C_u$, $P_2 : H \rightarrow M$ be the projections. In the sequel, we consider nonexpansive functions $T : H \rightarrow H$ satisfying

$$\forall (x, u) \in H ((P_1 \circ T)(x, u) \in C_u). \quad (13)$$

It is easy to see that we can define for each $u \in M$ the nonexpansive function

$$T_u : C_u \rightarrow C_u, \quad T_u(x) = (P_1 \circ T)(x, u).$$

For each $u \in M$, we denote the Krasnoselski-Mann iteration starting from $x \in C_u$ and associated with T_u by (x_n^u) (or by (x_n) , when u is clear from the context).

For each $n \geq 0$, we define

$$\varphi_n : M \rightarrow M, \quad \varphi_n(u) = (P_2 \circ T)((\delta(u))_n, u).$$

The following results can be proved in a similar manner as Lemmas 2.1, 2.2, and Theorems 2.3, 2.4.

Lemma 2.7. (i) for all $n \geq 0$, $u, v \in M$, and $x \in C_u, y \in C_v$

$$\rho(x_n^u, y_n^v) \leq \max\{\rho(x, y), d(u, v)\} = d_\infty((x, u), (y, v)); \quad (14)$$

(ii) for all $n \geq 0$, φ_n is nonexpansive;

(iii) there is a sequence (z_n) in M such that for all $n \geq 0$,

$$d(z_n, \varphi_n(z_n)) \leq \frac{1}{n}, \text{ and} \\ d_\infty(((\delta(z_n))_n, z_n), T((\delta(z_n))_n, z_n)) \leq \max\left\{\rho((\delta(z_n))_n, T_{z_n}((\delta(z_n))_n, \frac{1}{n})\right\}.$$

Lemma 2.8. Let $(\lambda_n), K, \alpha$ be as in the hypothesis of Theorem 1.3.

Assume that $b_1, b_2 > 0$ are such that

$$\forall u \in M \exists x^* \in C_u (\rho(\delta(u), x^*) \leq b_1 \wedge \rho(x^*, T_u(x^*)) \leq b_2). \quad (15)$$

Then there are sequences (z_n) and (x_n^*) such that

$$\forall n \in \mathbb{N} (z_n \in M \wedge x_n^* \in C_{z_n} \wedge \rho(\delta(z_n), x_n^*) \leq b_1 \wedge \rho(x_n^*, T_{z_n}(x_n^*)) \leq b_2)$$

and for all $\varepsilon > 0$,

$$\forall n \geq g(\varepsilon, b_1, b_2, K, \alpha) (d_\infty(((\delta(z_n))_n, z_n), T((\delta(z_n))_n, z_n)) \leq \rho(x_n^*, T_{z_n}(x_n^*)) + \varepsilon),$$

where $g(\varepsilon, b_1, b_2, K, \alpha)$ is as in Lemma 2.2.

Theorem 2.9. Assume that

$$\sup_{u \in M} r_{C_u}(T_u) < \infty.$$

Suppose also that $\varphi : \mathbb{R}_+^* \rightarrow \mathbb{R}_+^*$ is such that for each $\varepsilon > 0$ and $v \in M$ there exists $x^* \in C_v$ satisfying

$$\rho(\delta(v), x^*) \leq \varphi(\varepsilon) \wedge \rho(x^*, T_v(x^*)) \leq \sup_{u \in M} r_C(T_u) + \varepsilon. \quad (16)$$

Then

$$r_H(T) \leq \sup_{u \in M} r_{C_u}(T_u).$$

Theorem 2.10. Let $(\lambda_n), K, \alpha$ be as in the hypothesis of Theorem 1.3.

Assume that there is $b > 0$ such that

$$\forall u \in M \exists y \in C_u (\rho(\delta(u), y) \leq b \wedge \forall m, p \in \mathbb{N} (\rho(y_m^u, y_p^u) \leq b)). \quad (17)$$

Then $r_H(T) = 0$.

We get also the following corollary:

Corollary 2.11. Assume that $(C_u)_{u \in M} \subseteq X$ is a family of nonempty bounded convex sets such that there is $b > 0$ with the property that

$$\forall u \in M (\text{diam}(C_u) \leq b). \quad (18)$$

Then H has the AFPP for nonexpansive mappings $T : H \rightarrow H$ satisfying (13).

Proof. The hypothesis of Theorem 2.10 is satisfied with $y := \delta(u)$. $\square \quad \square$

3 Uniform approximate fixed point property

Let (X, ρ) be a metric space, $C \subseteq X$ a nonempty subset, and $\mathcal{F}$ be a class of functions $T : C \rightarrow C$. We say that C has the *uniform approximate fixed point property (UAFPP)* for $\mathcal{F}$ if for all $\varepsilon > 0$ and $b > 0$ there exists an $D > 0$ such that for each point $x \in C$ and for each function $T \in \mathcal{F}$,

$$\rho(x, T(x)) \leq b \Rightarrow \exists x^* \in C (\rho(x, x^*) \leq D \wedge \rho(x^*, T(x^*)) \leq \varepsilon). \quad (19)$$

Let (X, ρ, W) be a hyperbolic space, and $C \subseteq X$ be a nonempty convex subset. Assume that (λ_n) is a sequence in $[0, 1]$. We say that C has the *λ_n -uniform asymptotic regularity property* if for all $\varepsilon > 0$ and $b > 0$ there exists an $N \in \mathbb{N}$ such that for each point $x \in C$ and for each nonexpansive function $T : C \rightarrow C$,

$$\rho(x, T(x)) \leq b \Rightarrow \forall n \geq N (\rho(x_n, T(x_n)) \leq \varepsilon), \quad (20)$$

where (x_n) is the Krasnoselski-Mann iteration defined as in (1).

These definitions are inspired by Theorem 1.3, our quantitative version of Borwein-Reich-Shafir Theorem, which can be used to prove the following equivalent characterizations.

Proposition 3.1. *Let (X, ρ, W) be a hyperbolic space, and $C \subseteq X$ be a nonempty convex subset. Then the following are equivalent:*

- (i) *C has the UAFPP for nonexpansive functions;*
- (ii) *C has the λ_n -uniform asymptotic regularity property for some (λ_n) in $[0, 1]$;*
- (iii) *C has the λ_n -uniform asymptotic regularity property for all (λ_n) in $[0, 1]$ which are divergent in sum and bounded away from 1.*

Proof. (iii) $\Rightarrow$ (ii) is obvious.

(i) $\Rightarrow$ (iii) Let $\varepsilon > 0, b > 0$, and $D > 0$ be such that (19) holds with $\mathcal{F}$ being the class of nonexpansive functions. Let (λ_n) in $[0, 1]$ be divergent in sum and bounded away from 1. Then there are $K \in \mathbb{N}$, and $\alpha : \mathbb{N} \rightarrow \mathbb{N}$ such that (2) holds. Let $x \in C$ and $T : C \rightarrow C$ nonexpansive be such that $\rho(x, T(x)) \leq b$. Then there is $x^* \in C$ such that $\rho(x, x^*) \leq D$, and $\rho(x^*, T(x^*)) \leq \varepsilon$. Let $b' := \max\{b, D\}$. Then

$$\rho(x, T(x)) \leq b', \quad \rho(x, x^*) \leq b',$$

so we can apply Theorem 1.3 to get $N := h(\varepsilon, b', K, \alpha)$ such that

$$\forall n \geq N (\rho(x_n, T(x_n)) \leq \rho(x^*, T(x^*)) + \varepsilon \leq 2\varepsilon).$$

(ii) $\Rightarrow$ (i) Let (λ_n) in $[0, 1]$ be such that C has the λ_n -uniform asymptotic regularity property. Let $\varepsilon > 0, b > 0$, and $N \in \mathbb{N}$ as in (20). Let now $x \in C$ and

$T : C \rightarrow C$ nonexpansive be such that $\rho(x, T(x)) \leq b$. Then $\rho(x_N, T(x_N)) \leq \varepsilon$, and

$$\begin{aligned} \rho(x, x_N) &\leq \sum_{i=0}^{N-1} \rho(x_i, x_{i+1}) = \sum_{i=0}^{N-1} \lambda_i \rho(x_i, T(x_i)) \\ &\leq \rho(x, T(x)) \sum_{i=0}^{N-1} \lambda_i, \text{ since } (\rho(x_n, T(x_n))) \text{ is nonincreasing} \\ &\leq b \sum_{i=0}^{N-1} \lambda_i. \end{aligned}$$

Let us take now $D := b \sum_{i=0}^{N-1} \lambda_i$, and $x^* := x_N$. Then (19) holds. $\square$ $\square$

Let us remark the following fact. A first attempt to define the property that C has the uniform approximate fixed point property for nonexpansive functions is in the line of the Goebel-Kirk Theorem [4], that is

$$\begin{aligned} \forall \varepsilon > 0 \exists D > 0 \forall x \in C \forall T : C \rightarrow C \text{ nonexpansive} \\ \exists x^* \in C (\rho(x, x^*) \leq D \wedge \rho(x^*, T(x^*)) \leq \varepsilon). \end{aligned} \quad (21)$$

If C is bounded, then C satisfies (21) by [4]. But also conversely, if C satisfies (21) (even if only for constant functions T) then C is already bounded: Assume that C satisfies (21) for all constant functions T . Then for $\varepsilon := 1$ we get $D_1 \in \mathbb{N}$ such that for all $x \in C$, and for all constant functions $T : C \rightarrow C$, there is $x^* \in C$ with $\rho(x, x^*) \leq D_1$ and $\rho(x^*, T(x^*)) \leq 1$. It follows that

$$\rho(x, T(x)) \leq \rho(x, x^*) + \rho(x^*, T(x^*)) + \rho(T(x^*), T(x)) \leq 2D_1 + 1 \quad (22)$$

Now, if we assume that C is unbounded, there are $x, y \in C$ such that $\rho(x, y) > 2D_1 + 1$. Define $T : C \rightarrow C$, $T(z) = y$ for all $z \in C$. Then $\rho(x, T(x)) = \rho(x, y) > 2D_1 + 1$ which contradicts (22).

The next results give some partial answers to problem 27 in [8] which asks whether the product $H = (C \times M)_\infty$ of a closed convex subset C of a complete CAT(0)-space X (having the geodesic line extension property) with the AFPP (or – equivalently – being geodesically bounded) and a metric space M having the AFPP again has the AFPP: we show that this is true if C has the UAFPP (even in the case where X is just a hyperbolic space) and a technical condition is satisfied which, in particular, holds if M is bounded:

Theorem 3.2. *Let (X, ρ, W) be a hyperbolic space, $C \subseteq X$ a convex subset with the UAFPP for nonexpansive functions, (M, d) be a metric space with the AFPP for nonexpansive functions, and $\delta : M \rightarrow C$ be a nonexpansive selection function. Let $T : H \rightarrow H$ be a nonexpansive function such that there exists $b > 0$ satisfying*

$$\forall u \in M (\rho(T_u(\delta(u)), \delta(u)) \leq b). \quad (23)$$

Then $r_H(T) = 0$.

Proof. Let $\varepsilon > 0$. Since C has the UAFPP for nonexpansive functions, there exists $D > 0$ (depending on ε and b) such that (19) holds for each nonexpansive function. For each $u \in M$, using (23) and applying (19) for $x := \delta(u)$ and T_u , we get $x^* \in C$ such that $\rho(\delta(u), x^*) \leq D$ and $\rho(x^*, T_u(x^*)) \leq \varepsilon$. Hence, the hypothesis of Corollary 2.5 is satisfied with $\varphi(\varepsilon) := D$, so $r_H(T) = 0$ follows. $\square$ $\square$

Corollary 3.3. *Let (X, ρ, W) be a hyperbolic space, and $C \subseteq X$ a convex subset with the UAFPP for nonexpansive functions. Assume that (M, d) is a bounded metric space with the AFPP for nonexpansive functions.*

Then $H := (C \times M)_\infty$ has the AFPP for nonexpansive functions.

Proof. Let $x \in C$ be arbitrary, and define $\delta : M \rightarrow C$ by $\delta(u) = x$. Let $T : H \rightarrow H$ be a nonexpansive function. Fix some $u_0 \in M$, and define $b := \rho(x, T_{u_0}(x)) + \text{diam}(M)$. Then for each $u \in M$, we have that

$$\begin{aligned} \rho(x, T_u(x)) &\leq \rho(x, T_{u_0}(x)) + \rho(T_{u_0}(x), T_u(x)) \\ &\leq \rho(x, T_{u_0}(x)) + d_\infty(T(x, u_0), T(x, u)) \\ &\leq \rho(x, T_{u_0}(x)) + d_\infty((x, u_0), (x, u)) \\ &= \rho(x, T_{u_0}(x)) + d(u_0, u) \leq b. \end{aligned}$$

Thus, we can apply Theorem 3.2 to conclude that $r_H(T) = 0$. $\square$ $\square$

We end this section by remarking that, using the same ideas, we can define the notion of C having the uniform fixed point property. Thus, C has the *uniform fixed point property (UFPP)* for $\mathcal{F}$ if for all $b > 0$ there exists $D > 0$ such that for each point $x \in C$ and for each function $T \in \mathcal{F}$,

$$\rho(x, T(x)) \leq b \Rightarrow \exists x^* \in C (\rho(x, x^*) \leq D \wedge T(x^*) = x^*). \quad (24)$$

Proposition 3.4. *Assume that (X, ρ) is a complete metric space. Let $\mathcal{F}$ be the class of contractions with a common contraction constant $k \in (0, 1)$. Then each closed subset C of X has the UFPP for $\mathcal{F}$.*

Proof. By Banach's Contraction Mapping Principle we know that each mapping $T \in \mathcal{F}$ has a unique fixed point x_0 , and, moreover, for each $x \in C$,

$$\rho(T^n(x), x_0) \leq \frac{k^n}{1-k} \rho(x, T(x)) \quad \text{for all } n \geq 0. \quad (25)$$

For $n = 0$, this yields $\rho(x, x_0) \leq \frac{1}{1-k} \rho(x, T(x))$. Then $\rho(x, T(x)) \leq b$ implies $\rho(x, x_0) \leq \frac{1}{1-k} b$. Hence, (19) holds with $D := \frac{1}{1-k} b$ and $x^* := x_0$. $\square$ $\square$

It is known that all directionally bounded closed convex subsets of complete hyperbolic spaces in the sense of [11] have the approximate fixed point property for all nonexpansive mappings and that there are (even for normed spaces)

unbounded but directionally bounded convex subsets ([12]). We conclude this paper with an

Open Problem: Are there unbounded convex subsets of some hyperbolic space which have the UAFPP for all nonexpansive mappings $T : C \rightarrow C$?
